

# Hands on Introduction to Machine Learning with IBM Watson Studio

Power of data. Simplicity of design. Speed of innovation.

**Bernie Beekman**  
**James Parry**  
**Prithvi Rao**

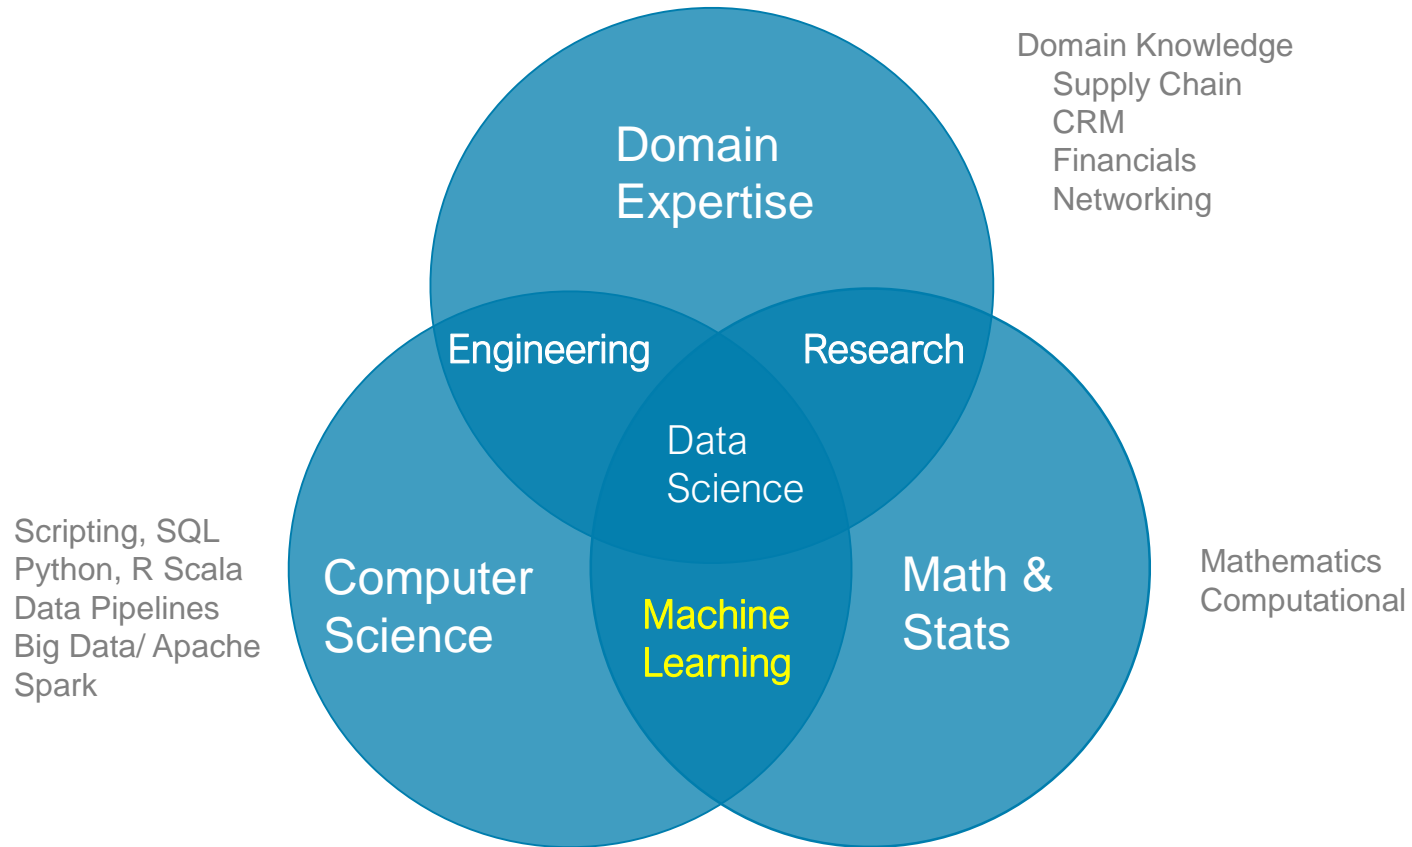

# Agenda

Time	Description
08:30 AM – 09:00 AM	Registration
09:00 AM – 10:30 AM	Introduction to Machine Learning
10:30 AM – 10:45 AM	Break
10:45 AM – 11:30 AM	Introduction to Watson Studio Lab Overview
11:30 AM – 11:45 AM	Lab 1 – Set up Environment
11:45 AM – 12:15 PM	Lab 2 – Machine Learning with XGBoost
12:15 PM – 12:45 PM	Lunch
12:45 PM – 01:15 PM	Lab 3 – Data Refinery
01:15 PM – 02:00 PM	Lab 4 – SPSS Modeler
02:00 PM – 02:45 PM	Lab 5 – AutoAI and DevOps
02:45 PM – 03:30 PM	Lab 6 – Watson OpenScale
03:30 PM – 04:15 PM	Lab 7 – Neural Network Modeler and Deployment
04:15 PM – 05:00 PM	Lab-8 – Adversarial Robustness Toolkit

- Evaluation

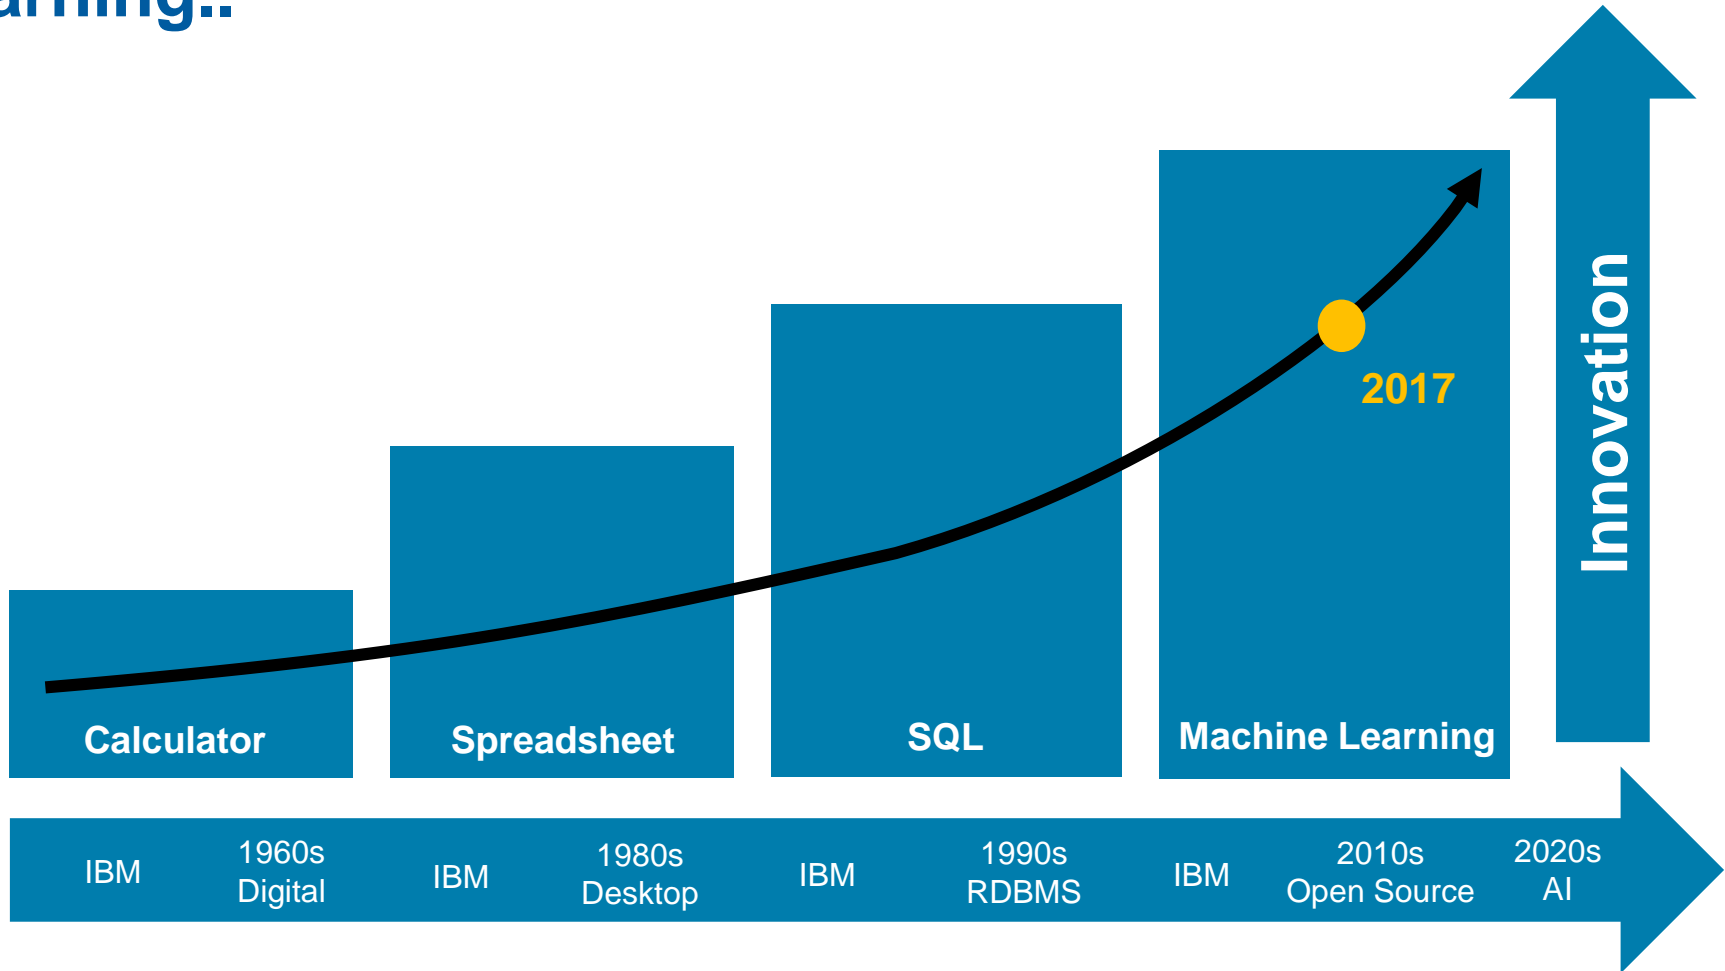

# Machine Learning and Data Science....

*Data Science Projects Require Multiple Skills*

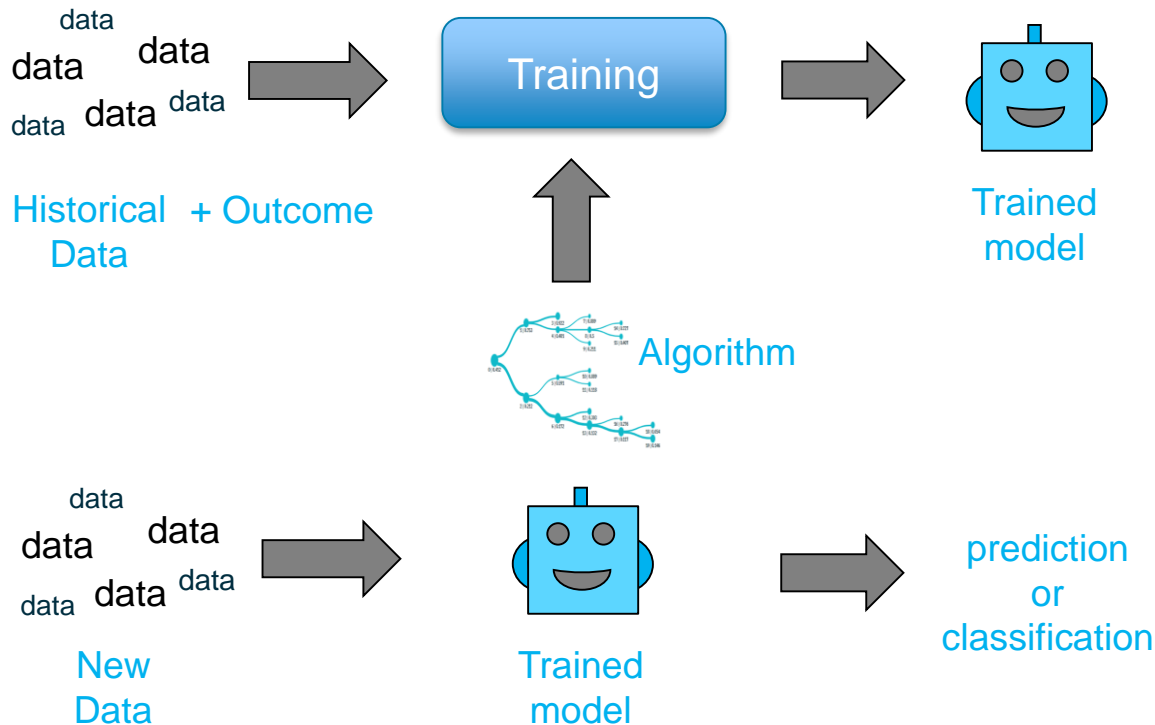

Modified from Drew Conway's Venn Diagram

# Future of Data Science is Democratizing Machine Learning..

# But what is Machine Learning?

*“Computers that learn without being **explicitly programmed**”*

1

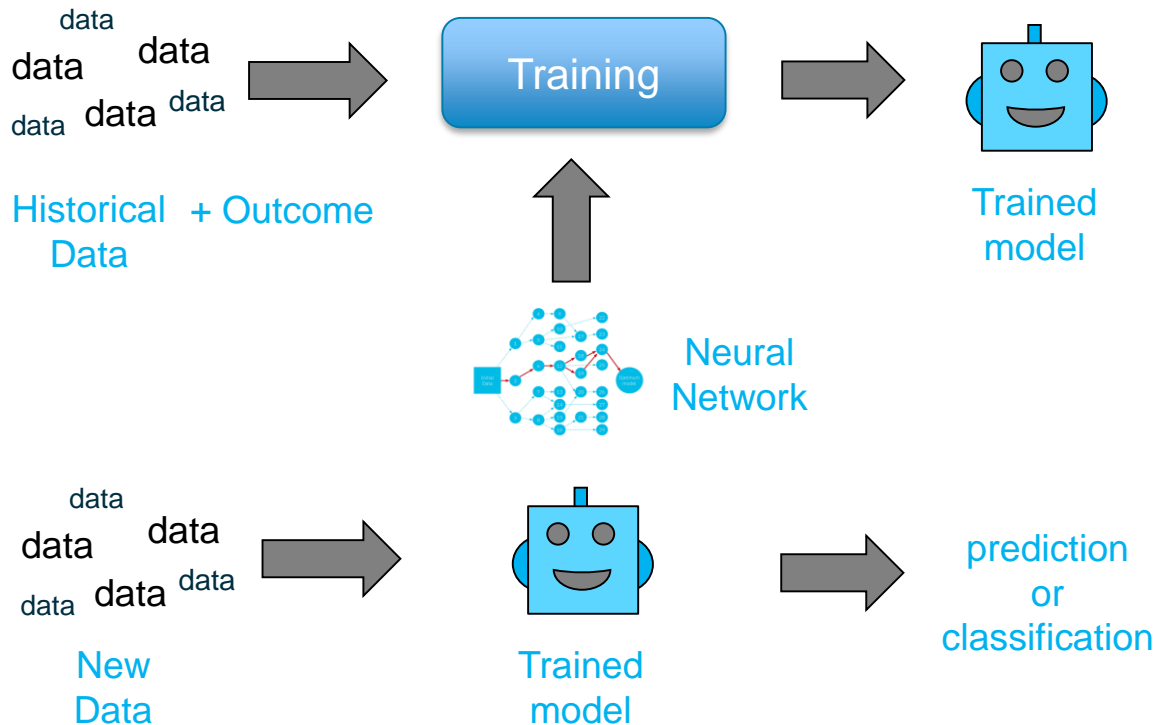

A machine learning model is trained to recognize patterns in historical data

2

The model is then shown new data and asked to predict or classify it. If the patterns in the new data match the training data then the model makes accurate predictions.

# But what is Deep Learning?

*“Computers that learn without being **explicitly programmed**”*

1

A machine learning model is trained to recognize patterns in historical data

2

The model is then shown new data and asked to predict or classify it. If the patterns in the new data match the training data then the model makes accurate predictions.

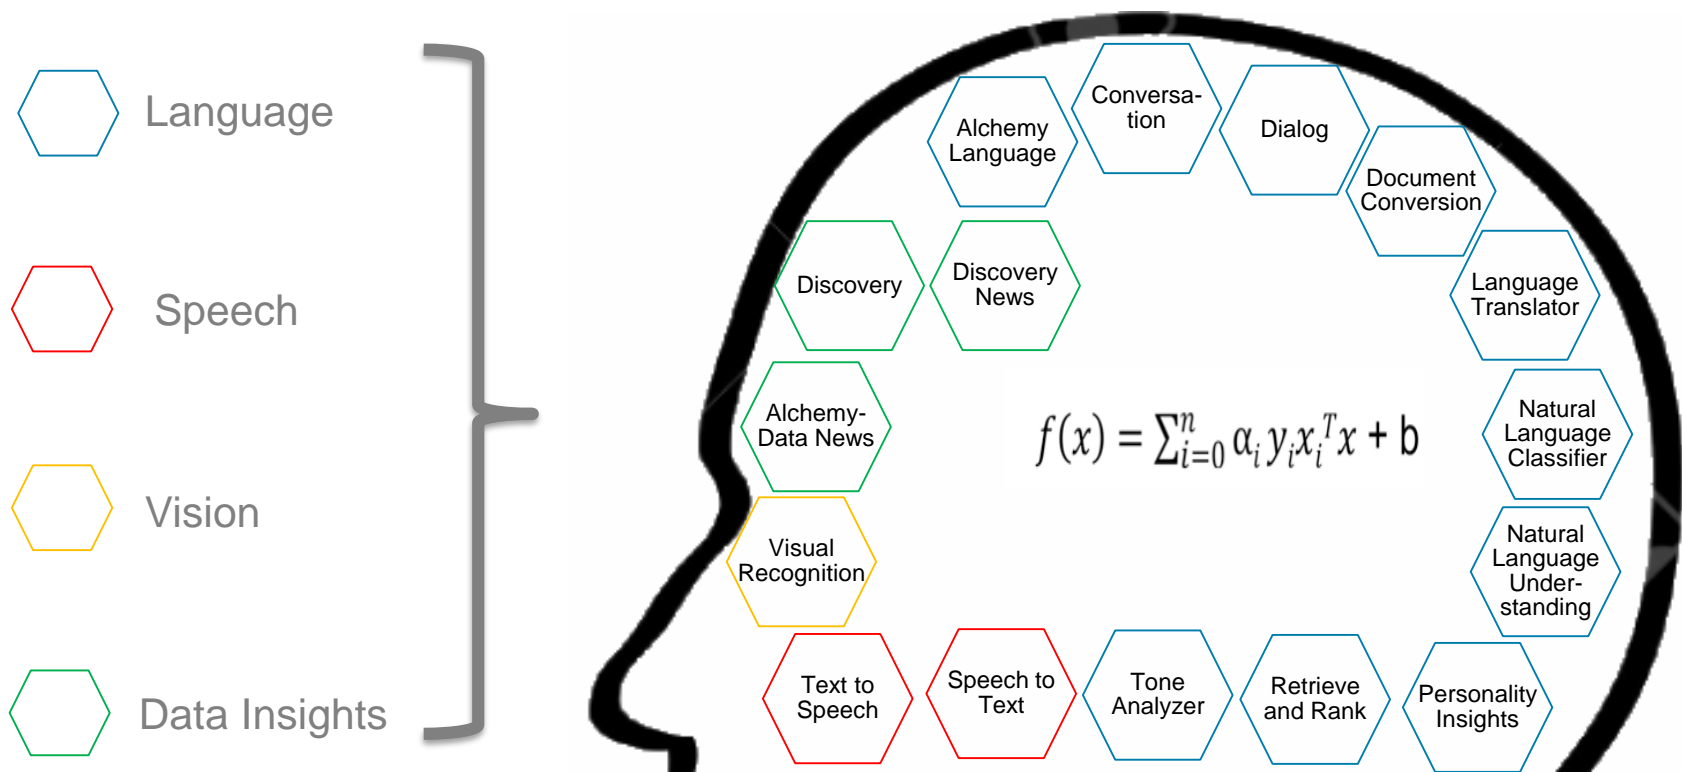

# But what is Artificial Intelligence?

A theory and development of computer systems able to perform tasks that normally require human intelligence, such as visual perception, speech recognition, decision-making, and translation between languages..

# Machine Learning = Artificial Intelligence???

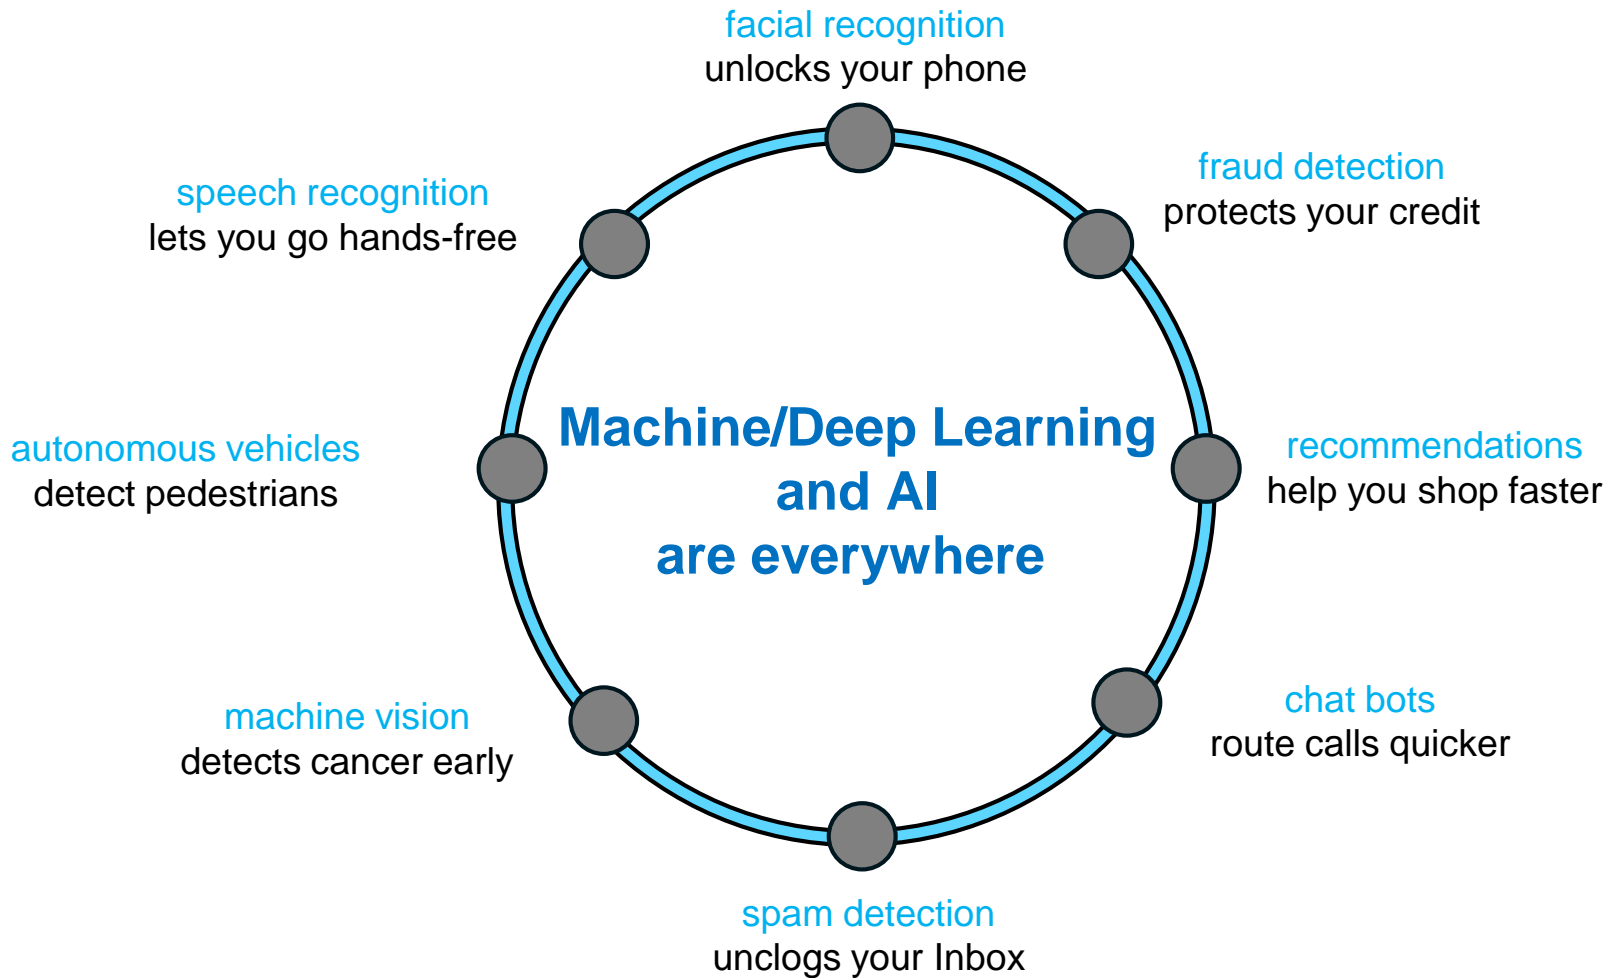

Data + Algorithms = Scored AI Models

# Understanding AI, ML & DL Relationship...

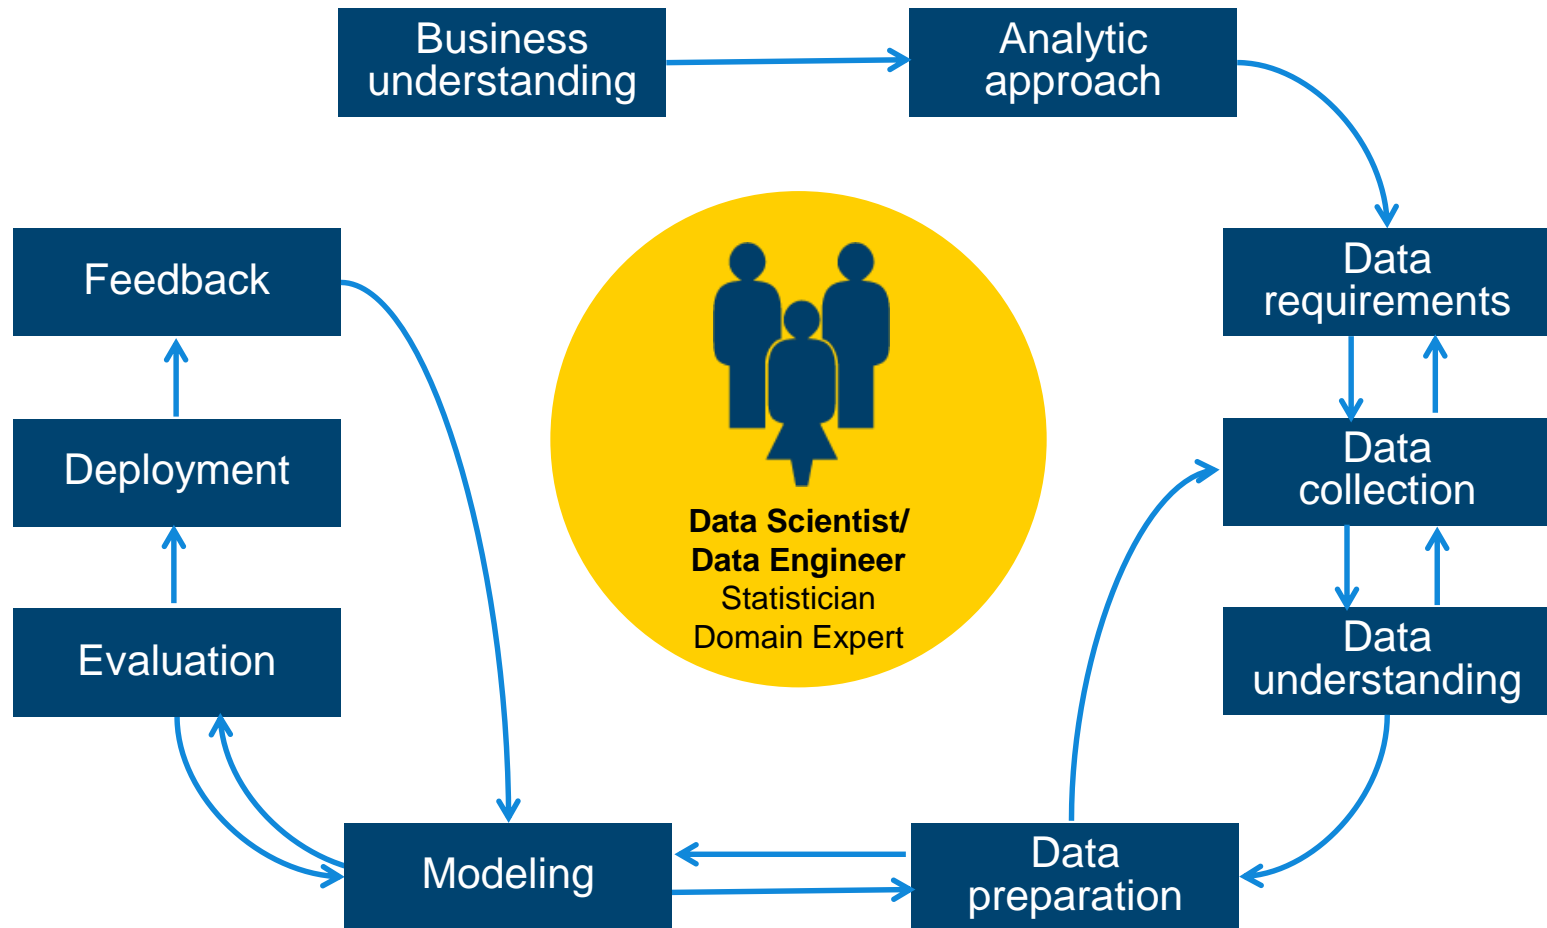

# The future is now

# Introduction to Machine Learning

- Overview

- Machine Learning Algorithms
- Model Evaluation

# Data Science Methodology

# Matrix for Machine Learning

## Known as:

- Attributes
- Features
- Predictor variables
- Explanatory variables

## Scale variables:

- Continuous variables, which can be measured on an interval scale or ratio scale
- 'Weight', 'Temperature', 'Salary', etc...

## Categorical variables:

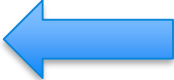

- Data with a limited number of distinct values or categories (nominal or ordinal)
- 'Hair color', 'Gender', 'Grape varieties', etc...

## Known as:

- Label
  - Target variable
  - Dependent variable
- Scale or Categorical

# Introduction to Machine Learning

- Data Preparation
- Categories of Machine Learning
- Learning Challenges
- Machine Learning Algorithms
- Model Evaluation

# Data Understanding – Data Audit

- **Data can be missing values**
  - Blank fields
  - Fields with dummy values (9999)
  - Fields with “U” or “Unknown”
- **Data can be corrupt or incoherent or anomalous:**
  - Data fields can be in the wrong format (strings where numbers are expected)
  - Spurious “End of Line” characters can chop original lines of data into several lines and cause data fields in the wrong place
  - Data entered in different formats: USA / US / United States
  - Data can be anomalous – outlier detection
- **Data can be duplicated**
- **Handling these data quality issues (as part of data preparation) is often referred to as:**
  - Data cleansing

# Data Understanding: Visualizations

The four data sets have similar statistical properties:

- The mean of  $x$  is 9
- The variance of  $x$  is 11
- The mean of  $y$  is approx. 7.50
- The variance of  $y$  is approx. 4.12
- The correlation is 0.816

As shown the linear regression lines are approx.  $y = 3.00 + 0.500x$ .

## ■ Anscombe's quartet

- The four datasets have nearly identical statistical properties (mean, variance, correlation), yet the differences are striking when looking at the simple visualization

# Introduction to Machine Learning

- Overview
- Data Science Methodology
- Data Understanding
- Data Preparation 
- Categories of Machine Learning
- Learning Challenges
- Machine Learning Algorithms
- Model Evaluation

# Data Preparation

- **Data preparation can be very time consuming depending on:**
  - The state of the original data
    - Data is typically collected in a “human” friendly format
  - The desired final state of the data (as required by the machine learning models and algorithms)
    - The desired final state is typically some “algorithm” friendly format
  - There may be a need for a (long) pipeline of transformations before the data is ready to be consumed by a model:
    - These transformations can be done manually (write code)
    - These transformations can be done through tools

# Data Preparation – Transformation

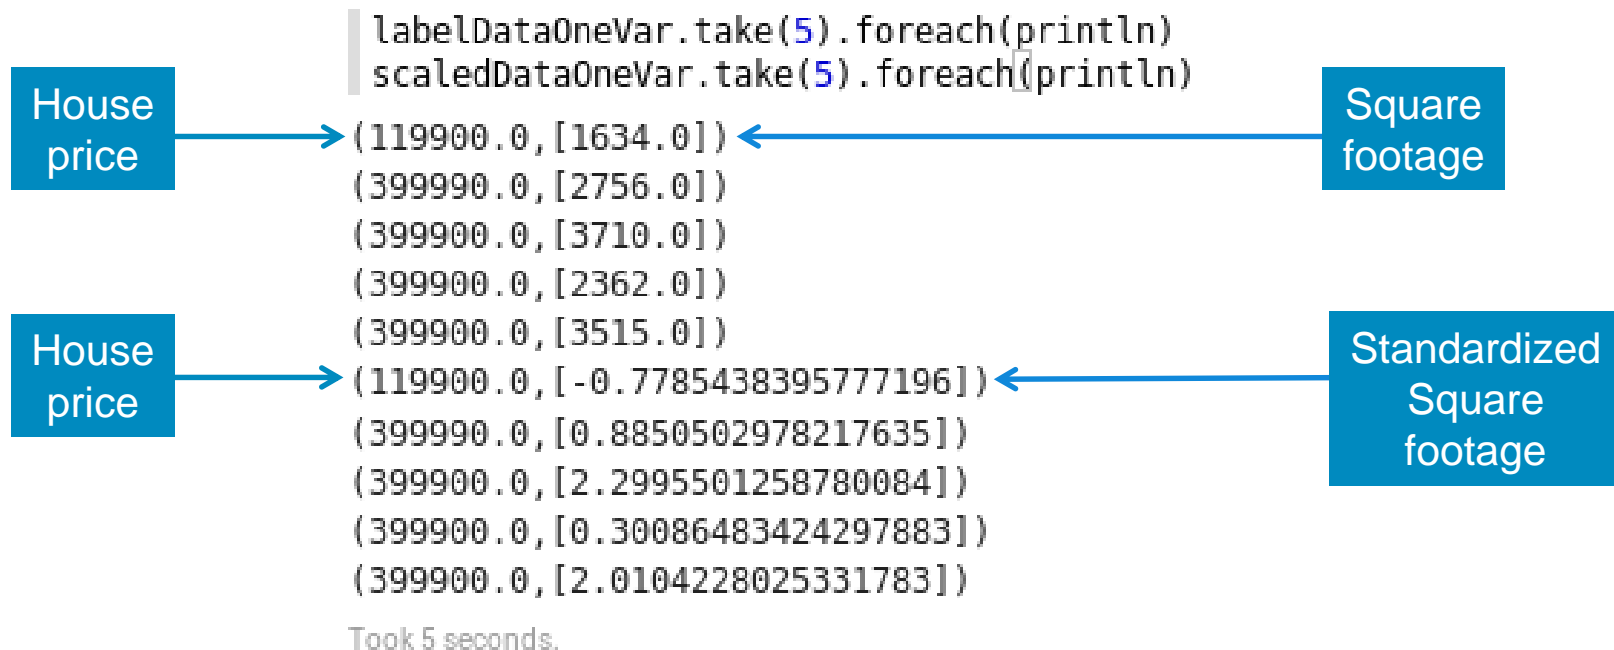

- **Data may need to be transformed to match algorithms requirements:**
  - Tokenizing (typical in text processing)
  - Vectorizing (several algorithms in Spark MLlib require this)
    - Transform data into Vector arrays
    - Can be done manually (write Python or Scala code)
    - Can be done using tools (VectorAssembler in the new ML package)
  - Bucketizing
    - Transform a range of continuous values into a set of buckets

# Data Preparation – Transformation

## ▪ Data may need to be transformed to match algorithms requirements:

### – Standardization

- Transform numerical data to values with zero mean and unit standard deviation
- Linear Regression with SGD in Spark MLlib requires this

# Data Preparation – Transformation

- **Data may need to be transformed to match algorithms requirements:**

- Normalization

- Transform data so that each Vector has a Unit norm.

$$x' = \frac{x}{||x||}$$

- Transform data so that each feature has a value between 0 and 1

$$X' = \frac{X - X_{\min}}{X_{\max} - X_{\min}}$$

- Categorical values need to be converted to numbers

- This is required by Spark MLlib classification trees
- Marital Status: {"Widowed", "Married", "Divorced", "Single"}
- Marital Status: {0, 1, 2, 3}
- You cannot do this if the algorithm could infer: Single = 3 X Married 😊

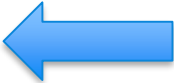

# Data Preparation – Transformation

- **Data may need to be transformed to match algorithms requirements:**
  - Dummy encoding
    - When categorical values cannot be converted to consecutive numbers
    - Marital Status: {"Single", "Married", "Divorced", "Widowed"}
    - Marital Status: {"0001", "0010", "0100", "1000"}
    - This is necessary if the algorithm could make some wrong inference from the numerical based categorical encoding:
      - ❑ Single = 3
      - ❑ Married = 2
      - ❑ Divorced = 1
      - ❑ Widowed = 0
        - > Single = Married + Divorced
        - > Single = Divorced x 3
        - > (this is a contrived example, but you get the idea ☺, replace marital status with colors... )

# Data Preparation – Dimensionality Reduction

- **Data dimensionality may need to be reduced:**
- **The idea behind reducing data dimensionality is that raw data tends to have two subcomponents:**
  - “Useful features” (aka structure)
  - Noise (random and irrelevant)
  - Extracting the structure makes for better models
  - Examples of applications of dimensionality reduction
    - Extracting the important features in face/pattern recognition
    - Removing stop words when working on text classification
    - Stemming: fishing, fished, fisher → fish
  - Examples methods of dimensionality reduction
    - Principal Component Analysis
    - Singular Value Decomposition
    - Autoencoders

# Introduction to Machine Learning

- Overview
- Data Science Methodology
- Data Understanding
- Data Preparation
- Categories of Machine Learning 
- Learning Challenges
- Machine Learning Algorithms
- Model Evaluation

# Categories of Machine Learning

## ■ Supervised learning

- The program is “trained” on a pre-defined set of “training examples”, which then facilitate its ability to reach an accurate conclusion when given new data
- The algorithm is presented with example inputs and their desired outputs (correct results)
- The goal is to learn a general rule that maps inputs to outputs

## ■ Unsupervised learning

- No labels are given to the learning algorithm, leaving it on its own to find structure (patterns and relationships) in its input
- Unsupervised learning can be a goal in itself (discovering hidden patterns in data) or a means towards an end (feature learning)

# Supervised vs. Unsupervised Learning

Supervised Learning

# Introduction to Machine Learning

- Overview
- Data Science Methodology
- Data Understanding
- Data Preparation
- Categories of Machine Learning
- Learning Challenges 
- Machine Learning Algorithms
- Model Evaluation

# Learning challenges

## ■ Under fitting:

- Not knowing enough “basic” concepts, i.e. not being well-equipped enough to tackle learning at hand:
  - You can’t study calculus without knowing some algebra.
  - You can’t learn playing hockey without knowing how to skate.
  - You can’t learn polo without knowing how to ride.
- This can lead to under fitting in Machine Learning: The chosen model is just not “sophisticated”, “rich”, enough to capture the concept.

# Learning challenges

- Over fitting:

- Hyper-sensitivity to minor fluctuations, ending up in modeling a lot of the unwanted noise in the data:
- This can lead to over fitting in Machine Learning.

# Model overfitting

- When building a predictive model, there is a risk of overfitting the model to the training data.
- The model fits the training data very well, but it does not perform well when applied to new data.

# Learning challenges

- Compromise between bias and variance:

# Graphical illustration of bias vs variance

Fig. 1 Graphical illustration of bias and variance.

- Model Evaluation

# Classification – Naïve Bayes (supervised)

- **Two or more outcomes.**
- **Assumes independence among explanatory variables, which is rarely true (thus “naïve”).**
- **Despite its simplicity, often performs very well... widely used.**
- **Significant use cases:**
  - Text categorization (spam vs. legitimate, sports or politics, etc.) using word frequencies as the features
  - Medical diagnosis (e.g., automatic screening)
  - Check a piece of text expressing positive emotions, or negative emotions?
  - Used for face recognition software.
- **Maximum conditional probability**
  - $Prob(Target|Input) = Prob(Input|Target) * \frac{Prob(Target)}{Prob(Input)}$

# Classification – Naïve Bayes

Input →

Outlook	Temp	Humidity	Windy	Play golf
Sunny	Hot	High	False	No
Sunny	Hot	High	True	No
Overcast	Hot	High	False	Yes
Rainy	Mild	High	False	Yes
Rainy	Cool	Normal	False	Yes
Rainy	Cool	Normal	True	No
Overcast	Cool	Normal	True	Yes
Sunny	Mild	High	False	No
Sunny	Cool	Normal	False	Yes
Rainy	Mild	Normal	False	Yes
Sunny	Mild	Normal	True	Yes
Overcast	Mild	High	True	Yes
Overcast	Hot	Normal	False	Yes
Rainy	Mild	High	True	No

← Target

# Classification – Naïve Bayes

Frequencies and probabilities for the weather data:

outlook			temperature			humidity			windy			play	
	yes	no		yes	no		yes	no		yes	no	yes	no
sunny	2	3	hot	2	2	high	3	4	false	6	2	9	5
overcast	4	0	mild	4	2	normal	6	1	true	3	3		
rainy	3	2	cool	3	1								

	yes	no		yes	no		yes	no		yes	no	yes	no
sunny	$\frac{2}{9}$	$\frac{3}{5}$	hot	$\frac{2}{9}$	$\frac{2}{5}$	high	$\frac{3}{9}$	$\frac{4}{5}$	false	$\frac{6}{9}$	$\frac{2}{5}$	$\frac{9}{14}$	$\frac{5}{14}$
overcast	$\frac{4}{9}$	$\frac{0}{5}$	mild	$\frac{4}{9}$	$\frac{2}{5}$	normal	$\frac{6}{9}$	$\frac{1}{5}$	true	$\frac{3}{9}$	$\frac{3}{5}$		
rainy	$\frac{3}{9}$	$\frac{2}{5}$	cool	$\frac{3}{9}$	$\frac{1}{5}$								

Tomorrow's weather prediction sunny, cool, high humidity, windy → play golf ??

**$Prob(\text{sunny}|\text{yes}) * Prob(\text{cool}|\text{yes}) * Prob(\text{high humidity}|\text{yes})Prob(\text{windy}|\text{yes})$**

**$Prob(\text{sunny}|\text{no}) * Prob(\text{cool}|\text{no}) * Prob(\text{high humidity}|\text{no})Prob(\text{windy}|\text{no})$**

## Classification – Naïve Bayes

$$\text{Prob}(\text{Input} \mid \text{yes}) = 2/9 * 3/9 * 3/9 * 3/9 = 0.0082$$

$$\text{Prob}(\text{Input} \mid \text{no}) = 3/5 * 1/5 * 4/5 * 3/5 = 0.0577$$

$$P(\text{yes}) = 9/14$$

$$P(\text{no}) = 5/14$$

$$\text{Prob}(\text{Input} \mid \text{yes}) * P(\text{yes}) = 0.0082 * (9/14) = 0.0053$$

$$\text{Prob}(\text{Input} \mid \text{no}) * P(\text{no}) = 0.0577 * (5/14) = 0.0206$$

The prediction would be: NO.

## Linear Regression (supervised)

- Draw a line, and then for each of the data points, measure the vertical distance between the point and the line, and add these up; the fitted line would be the one where this sum of distances is as small as possible.
- Use case:
  - Housing prices

# Logistic Regression (supervised)

- **Logistic regression is a powerful statistical way of modeling a binomial outcome with one or more explanatory variables. It measures the relationship between the categorical dependent variable and one or more independent variables by estimating probabilities using a logistic function, which is the cumulative logistic distribution.**

# Classification – Decision tree (supervised)

Modeling

- **Class variable (target) with two or more outcomes.**
- **Splits records in a tree-like series of nodes along mutually-exclusive paths.**
  - Algorithm decides which variable and threshold value to use at each split
  - New records are predicted (classified) based on the leaf assignment
  - Accurate
  - Explicit decision paths
- **Can also handle continuous target (“regression tree”).**

# Clustering – K-means method

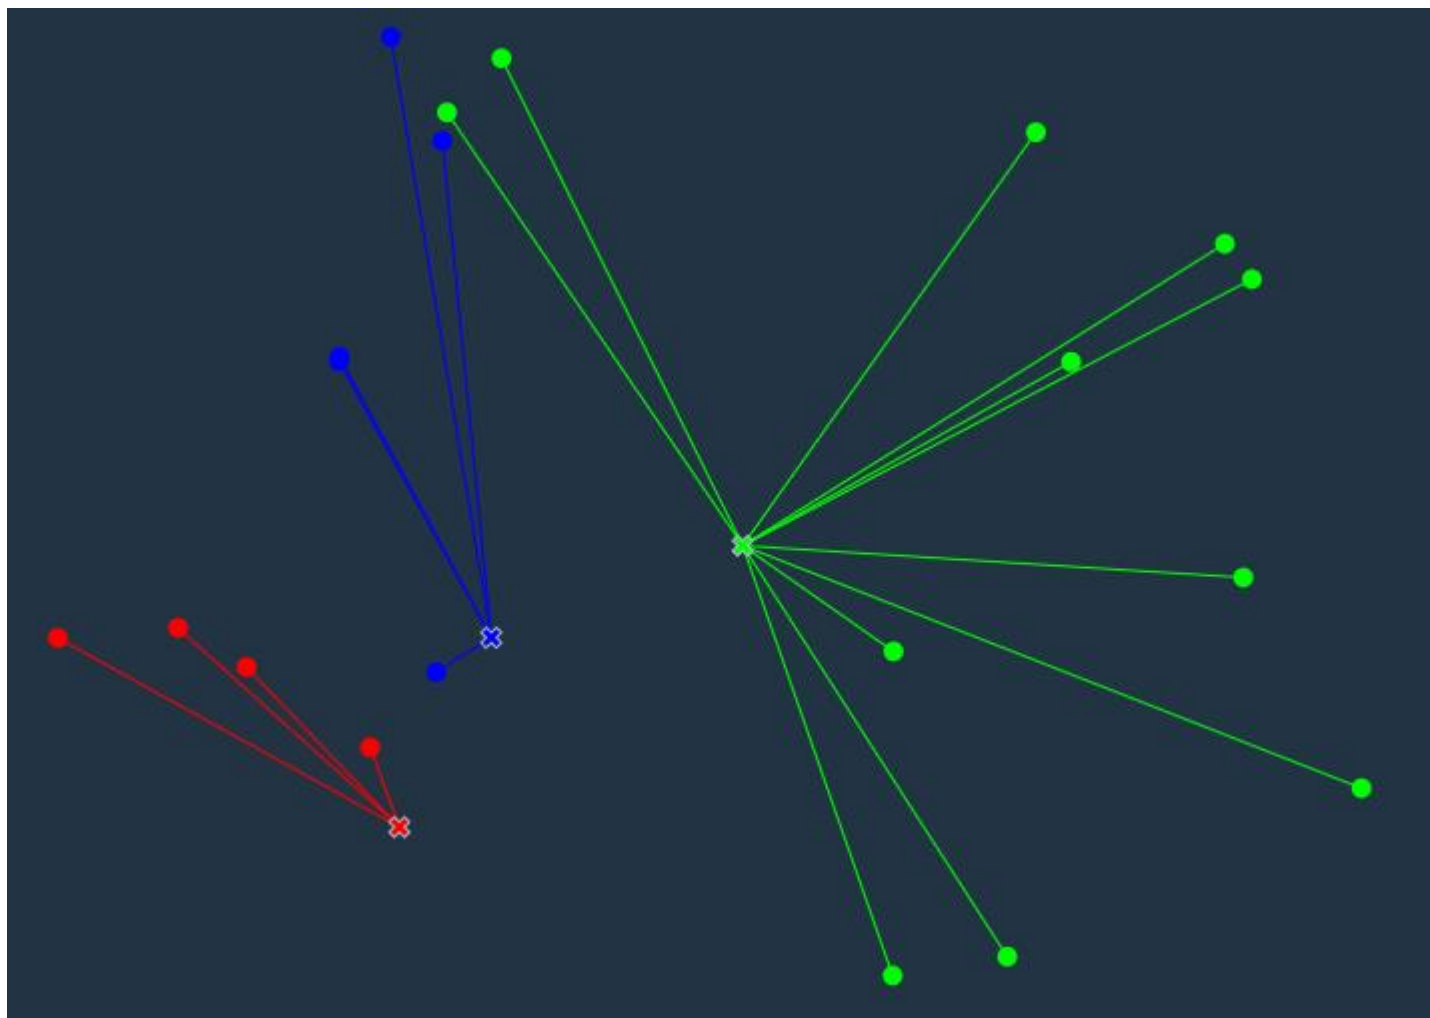

Modeling

Start with 20 data points and 3 clusters

# Clustering – K-means method

Modeling

Assign each data point to the nearest cluster

# Clustering – K-means method

Modeling

Calculate centroids of new clusters

# Clustering – K-means method

Modeling

Assign each data point to the nearest cluster

# Clustering – K-means method

Modeling

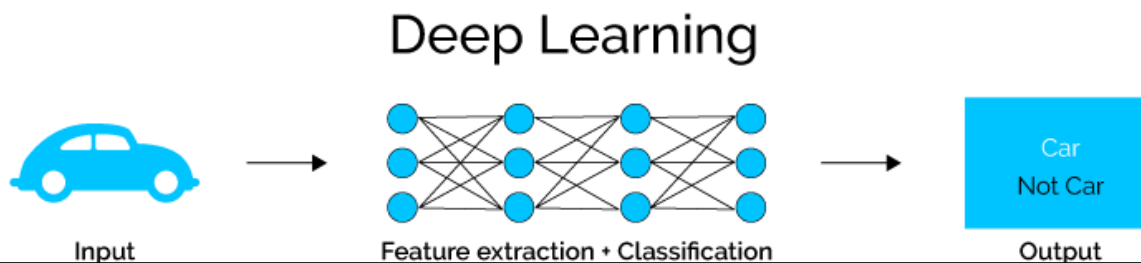

Calculate centroids of new clusters...until convergence

# Ensemble Modeling

- **Use a collection or ensemble of models instead of a single model to create more reliable and accurate predictive models**
- **Bagging**
  - New training datasets are generated based on random sampling with replacement of the original data set
  - Models are constructed for each sample and the results are combined
  - Random Forest is bagging applied to Decision Trees
- **Boosting**
  - Successive models are built to predict observations misclassified from earlier models.
  - Gradient boosting - train each subsequent model on the residuals (error between predicted value and actual value).

# Deep Learning

- Deep Learning is a machine learning method.
- Could be supervised or unsupervised
- Originated in 1940s
- Became very popular this decade
  - Hardware Improvements/Cost – GPUs, Storage
  - Availability of Large Datasets for Training
  - Better performing algorithms.
- Especially good for human perception type task

# What is an Artificial Neuron

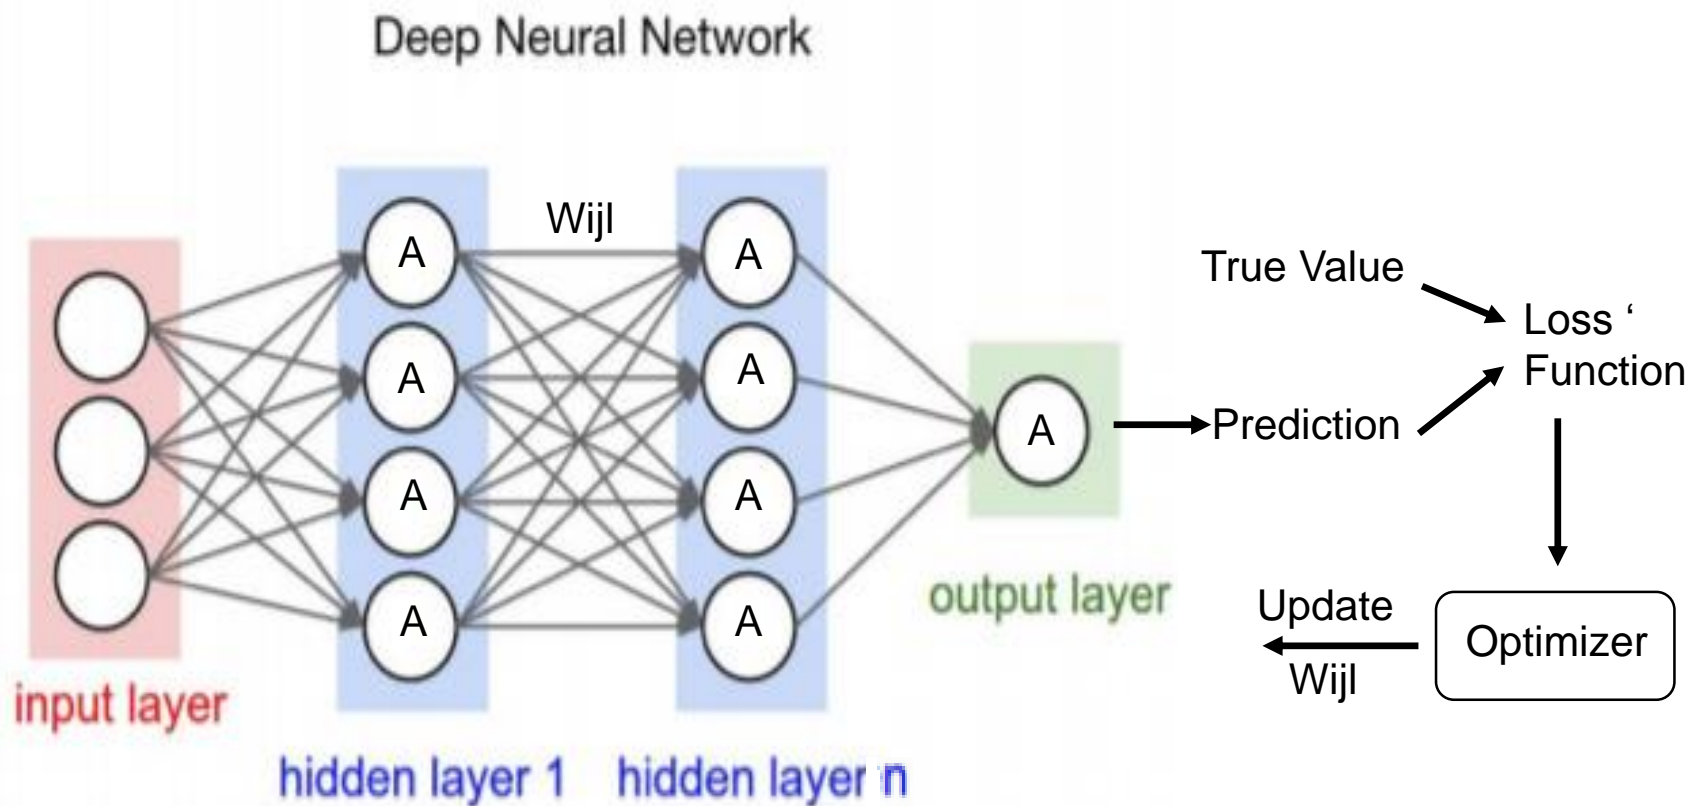

# Neural Network

Modeling

Training the AI is the hardest part of Deep Learning.

- You need a large data set.
- You need a large amount of computational power

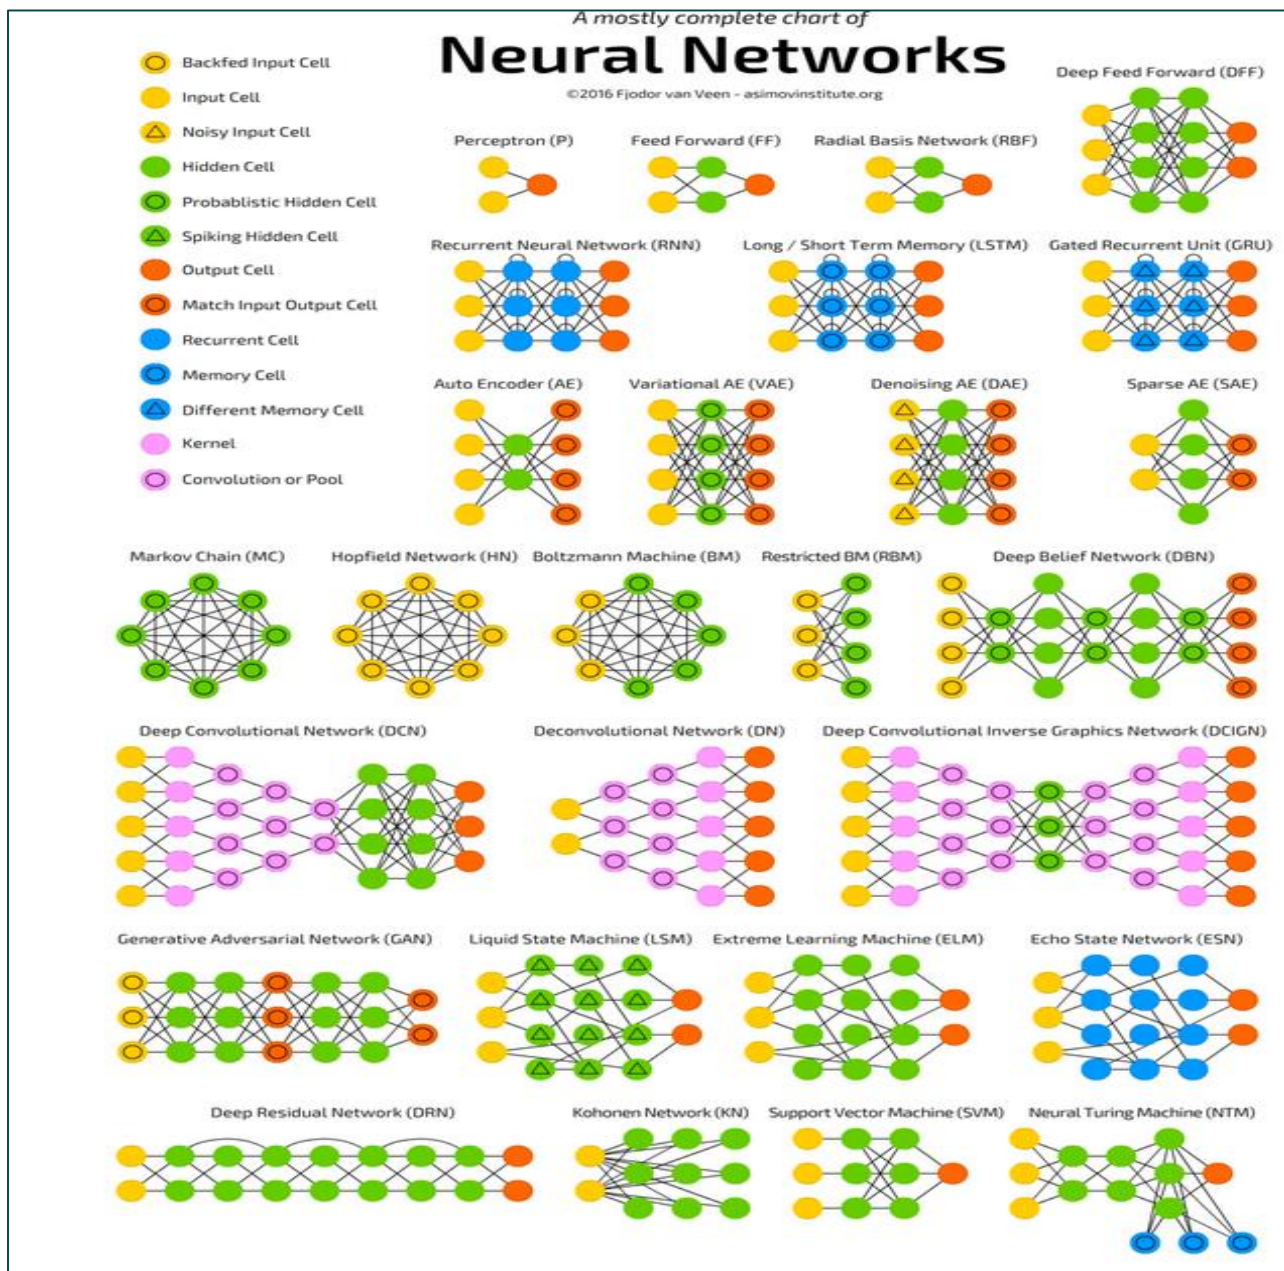

$W_{ijl}$  – weight from neuron (i) in level (l-1) to neuron (j) in level (l)

# Cost Function

- During training we need to know how our DNN is doing!
  - Compare it's predictions to dataset's output
  - Based on how far it is from actual value → update weights
- This function that does this is called "Cost Function"
- Ideally, we want our cost function to be zero.
  - Does not happen in real world
  - use techniques like "Gradient Descent" → allows us to find the minimum of a function by iterating through dataset and updating the weights

# Common Types of Deep Neural Networks

## Convolutional Neural Networks

- Images recognition
- Images classifications
- Objects detections
- Recognizing faces
- Natural language processing
- ..

## Recurrent Neural Networks

- Speech Recognition
- Handwriting Recognition
- Machine Translation
- Sequence prediction
- Natural Language Processing
- ...

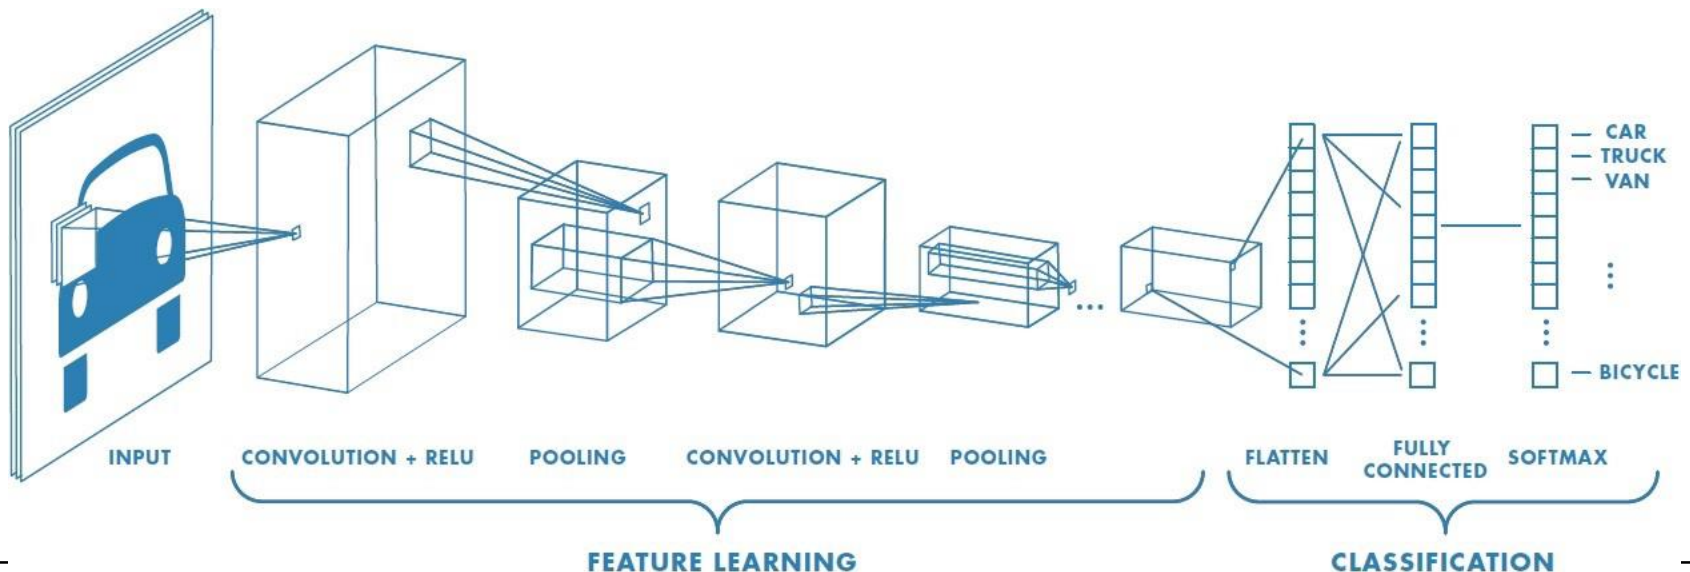

# Convolutional Neural Networks (CNN)

- Inspired by the architecture of the visual cortex → convolutional neural network
- Some neurons only react to horizontal lines, while others reacts to lines with different orientations
- Some neurons have larger receptive fields, so they react to more complex patterns based on output of lower-level neuron
- Two building blocks: **Convolutional** layers and **Pooling** layers

# Convolutional Layer

- Convolution is the first layer to extract features from an input image.
- Neurons in the first convolutional layer are not connected to every pixel in the input image, but **only to pixels in their receptive fields**
- Each neuron in the second convolutional layer is connected only to **neurons located within a small rectangle** in the first layer.
- Convolution preserves the relationship between pixels by learning image features using small squares of input data.

# Pooling Layer

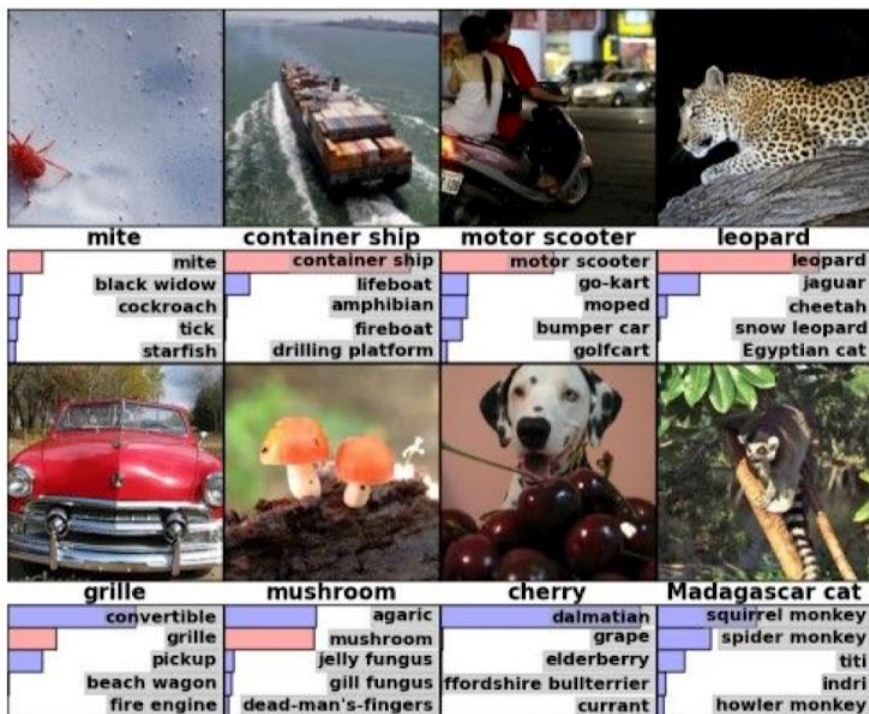

- Pooling Layer reduce the number of parameters when the images are too large.
  - Max Pooling
  - Average Pooling
  - Sum Pooling

# CNN Applications

# Recurrent Neural Networks (RNN)

- Humans don't start their thinking from scratch every second. We rely on our memory!
- Traditional Neural Networks **CAN NOT** help → data flows forward only
- Recurrent Neural Networks address this issue.
  - They are networks with loops in them, allowing information to persist.
- RNN Applications are: Speech recognition, Language modeling, Translation

An unrolled recurrent neural network.

# Long-Term Dependencies Problem

- RNNs can look at old information. But how old?
- Successfully uses recent information → Clouds are in the ... [Sky]

- Can NOT use older information → I grew up in France, in a small city near Paris, so I speak fluent ... [??] **But why?**

# Long-Term Dependencies Problem

- **Vanishing gradients**
  - $0 < \text{Gradient values} < 1 \rightarrow$  they leave the connection weights **unchanged**
- **Exploding gradients**
  - Calculated gradients are large values  $\rightarrow$  many layers got **insanely large** weight updates, and the network becomes unstable and diverged
- **Long Short Term Memory (LSTM) fixed the gradient problem**
  - by introducing a few more gates that control access to the cell state

The repeating module in RNN contains a single layer.

The repeating module in LSTM contains four interacting layers

# Introduction to Machine Learning

- Overview
- Data Science Methodology
- Data Understanding
- Data Preparation
- Categories of Machine Learning
- Learning Challenges
- Machine Learning Algorithms
- Model Evaluation 

# Training, testing, & validation sets

- During the model development process, supervised learning techniques employ **training** and **testing** sets and sometimes a **validation set**.
  - Historical data with known outcome (*target, class, response, or dependent variable*)
  - Source data randomly split or sampled... mutually exclusive records
- **Why?**
  - Training set → build the model (**iterative**)
  - Validation set → tune the parameters & variables during model building (**iterative**)
    - Assess model quality during training process
    - Avoid overfitting the model to the training set
  - Testing set → estimate accuracy or error rate of model (**once**)
    - Assess model's expected performance when applied to new data

# K-Fold Cross Validation

- Instead of using a separate validation set
- Shuffle Training Samples and sub-divide into “K” folds (groups)
- Train “K” models using K-1 folds as training data and 1 Fold as Test Data
- For example, K=4
  - Model 1 Train on 1,2,3 Test on 4 – calculate and store E1 (Error)
  - Model 2 Train on 2,3,4 Test on 1 – E2
  - Model 3 Train on 3,4,1 Test on 2 - E3
  - Model 4 Train on 4,1,2 Test on 3 - E4
  - $E = (E1+E2+E3+E4)/4$
- A common value for K is 10

# Model Evaluation: Confusion Matrix

**Confusion matrix is more useful measure than simply using prediction accuracy**

- Provides a better visualization of the performance of the algorithm
- Examine the count of each of these boxes

		Predicted	
		Has Disease	No Disease
Actual	Has Disease	true positive (tp) 	false negative (fn) No Treatment
	No Disease	false positive (fp) Unnecessary Treatment	true negative (tn) 

Precision =  $tp / (tp + fp)$       Recall = sensitivity = True Positive Rate  $tp / (tp + fn)$

FPR =  $fp / (fp + tn)$       1 – specificity      ROC = plot of TPR/FPR at different thresholds

# Model Evaluation: Confusion Matrix

**Confusion matrix is more useful measure than simply using prediction accuracy**

- Provides a better visualization of the performance of the algorithm
- Examine the count of each of these boxes

		Predicted	
		Has Disease	No Disease
Actual	Has Disease	true positive (tp) 	false negative (fn) No Treatment
	No Disease	false positive (fp) Unnecessary Treatment	true negative (tn) 

$$\text{Precision} = \text{tp} / (\text{tp} + \text{fp})$$

$$\text{Recall} = \text{sensitivity} = \text{True Positive Rate} = \text{tp} / (\text{tp} + \text{fn})$$

$$\text{FPR} = \text{fp} / (\text{fp} + \text{tn}) \quad 1 - \text{specificity}$$

$$\text{ROC} = \text{plot of TPR/FPR at different thresholds}$$

# Model Evaluation: Confusion Matrix

$$\text{Recall} = \text{sensitivity} = \text{True Positive Rate} = \text{tp} / (\text{tp} + \text{fn})$$

$$\text{FPR} = \text{fp} / (\text{fp} + \text{tn}) = 1 - \text{specificity}$$

ROC = plot of TPR/FPR at different thresholds

## Model Evaluation

- When you are building a classifier, it is important to understand the **PREVALANCE** of the condition that you are building a model for,  
i.e. how common or uncommon this condition effectively is...
- Imagine you are working towards building a classifier for some medical condition and your training and testing data sets yield the following model

	Test positive	Test negative
Disease (100)	95 (True Positive)	5 (False Negative)
Normal (100)	5 (False Positive)	95 (True Negative)

**Accuracy = 95%    Recall = 95%    Precision=95%**

## Model Evaluation

- What truly matters to the users of your new model / test (doctors, bankers, practitioners) is the **PREDICTIVE VALUE** of the test:
  - If the test is positive, then what is the actual chance of being sick?
  - Is it 95% ?
- Let's run the test on a population of 1,000,000 where 1% individuals (10,000) are actually suffering from this condition:

	Test positive	Test negative
Disease (10000)	9500 (95% True Positive)	500 (5% False Negative)
Normal (990000)	49500 (5% False Positive)	940500 (95% True Negative)

**Accuracy = 95%    Precision=16.1%    Recall = 95%**

What is happening here:

The condition is RARE and the 5% FALSE POSITIVES are still way higher in numbers than the true positives. Need 99% or higher specificity.

## Model Evaluation - Metrics

- **Accuracy** =  $\frac{\text{Correct Predictions}}{\text{Total Predictions}} = \frac{Tp+Tn}{Tp+Tn+Fp+Fn}$
- **F1** =  $2 * \frac{\text{Recall} * \text{Precision}}{\text{Recall} + \text{Precision}}$
- **Area under Receiver Operating Characteristic (ROC)**

[Source](#)

## Some items to think about ....

- **Business**

- What are your goals?
- What are the criteria for success?

- **Data**

- Do you need labeled (\$\$) data?
- What is the quality of your data?
- What features are pertinent?
- Do you have enough data?
- How are you going to obtain the data?

- **Models**

- What algorithms to use?
- What metrics to evaluate the algorithms?
- Would ensembles help?

- **Implementation**

- How quickly does a new instance need to be classified (online/batch)?
- Do you need to scale?
- What resources do you have? Memory?, GPUs?, Compute?
- How are you going to get feedback?
